

BIOTURM® **Information**

Bioturm skin protection effect

The BIOTURM skin protection is effective on the skin's surface and below. The special BIOTURM lacto intensive active complex is giving a protection layer to the skin and helps to avoid pH factor variations. Natural lactic acid helps to normalize the skin's acid protection cover so that a normal skin flora can be created again.

The lacto intensive active complex contains all important free amino acids. They can be taken up well from the skin so that they can normalize the skin's moisture. Micronutrients can provide for active substances which are similar to the skin. Vitamins like e. g. provitamin B5 and vitamin E are important for a physiological balance and can influence moisture and softness as natural factors to keep moist. Natural oils together with the lacto intensive active complex create a protection layer on the skin and can also influence the skin's moisture. Natural biologic protection measures are normalized and the skin is stimulated to regenerate.
